ADCI Process Queue

ADCI software processes samples using a queue system within which one sample is processed at a time. For more information on adding samples to this queue, view the sample page. Items in the process queue can be processed individually by highlighting an item in the process queue and clicking the icon. All items currently in the process queue can be processed sequentially in one click by clicking the icon.

Note in the event of an unexpected shutdown of the software while multiple samples are being processed in the queue, some completed samples may be recoverable. Consult the sample recovery page for more information.
